Ford Conversion Flywheel with Kevlar® Pilot Bushing

This flywheel (part number 167323) includes a unique accessory that is designed to provide longer life and lasting durability.

Kevlar® Bushing

A Kevlar® bushing has been installed in this flywheel, replacing the needle-style bearing typically used in this application. That's because the needle bearing is prone to premature failure, resulting in transmission input shaft damage and subsequent clutch failure. The Kevlar® bushing provides two important advantages:

1. It will not fail in severe duty applications.
2. It will accept a scored transmission input shaft, as long as the transmission input shaft mating surface is "cleaned up" by removing irregularities and high spots associated with a prior needle bearing failure.

Kevlar® Bushing

OEM Needle Bearing

For those that insist on using only OEM replacement parts, an OEM needle bearing has been included with the matching clutch kit. To install the needle bearing, remove the Kevlar® bushing using the proper sized bushing-driver or a 7/8" deep wall socket with a ball peen hammer. Drive the Kevlar® bushing out from the engine side of the flywheel. Install the needle bearing in the reverse order.
